What's on your seed?

Extension
UNIVERSITY OF WISCONSIN-MADISON

Seed treatments have been used for years, mostly for protection against seedling diseases. However, there are a number of treatments marketed for protection against insects and nematodes, and others that promote plant health. The purpose of this publication is to clarify the intended use of treatments registered in Wisconsin for field corn, soybean, small grain and/or alfalfa seed.

Seed treatments are listed by:

- The number of active ingredients, ranging from one to six
- By treatment type: **F** fungicide | **I** insecticide | **N** nematicide | **P** plant growth regulator
- Then alphabetically by the product trade name

The content of this table is not an endorsement of the seed treatments and is not an endorsement or criticism of one product over another. You are responsible for using pesticides according to the manufacturer's current label directions.
